## Test Procedure for the NV47710PDAJGEVB Evaluation Board

## Test Procedure:

1. Connect the test setup as shown in Figure 1. See Table 1 with required equipment.

- Letter F - Force line
- Letter S - Sense line

2. Select output current limit by connecting jumper $\mathbf{J}_{5}-\mathbf{J}_{8}$.

- $\mathrm{J}_{5}-\mathrm{I}_{\text {Limo }} \sim 10 \mathrm{~mA}$
- $\mathbf{J}_{6}$ - LIM $^{1} \sim 170 \mathrm{~mA}$
- $\mathrm{J}_{7}$ - $\mathrm{I}_{\mathrm{LIM2} 2} \sim 340 \mathrm{~mA}$
- $J_{8}-I_{\text {LIM }}-\mathrm{R}_{\mathrm{CSO}}$ position available for individual current limit setting by resistor from range $728 \Omega$ to $25.5 \mathrm{k} \Omega$

3. Set Input Voltage and turn on Power Supply.
4. Enable chip by connecting external Voltage Source on jumper $\mathrm{J}_{3}$. Output voltage must be higher than 2.31 V but maximally 7 V .
5. Set load current (max 350 mA ) and turn on Load.
6. Monitor Output voltage, it's given according to Equation 1.

$$
\begin{equation*}
V_{\text {out }}=1.275\left(1+\frac{B_{1}}{A_{2}}\right) \tag{eq.1}
\end{equation*}
$$

7. Monitor CSO voltage on connector $\mathrm{J}_{4}$. It should be max 2.55 V in steady state. The CSO voltage is proportional to output current according to Equation 2.

$$
V_{\operatorname{cso}}=I_{\text {out }}\left(R_{\operatorname{css}} \times \frac{1}{100}\right)
$$

8. Compare your results with measured results in Table 2.
